April 26, 2017

Greetings,

I'm writing on behalf of James Hang, an exceptional student that I've come to know over his two-years of study in the computer programming department of Ridgewater College in Hutchinson, Minnesota.

My first encounter with James was as a student in my four-credit C#.NET programming class. James always turned in his work on time, showed advanced programming skills and was willing to help other classmates in writing and debugging their programs.

James became a work study tutor for the computer department helping dozens of students in their struggle to learn computer programming basics. I'm sure many of my Automation students would not have passed their Intro to Programming and C#.NET classes without the encouragement and coaching from James.

James also took the micro-controller class that I taught this last semester. I used a new book and got stuck a couple times not having the right parts on hand to build the Arduino circuit projects. I would turn to James who was always able to build the circuits and to make the code work – often in very innovative ways combining several programs and reassigning hardware resources. One project was using two Arduino with XBee transceivers to wirelessly control devices across several hundred feet of space.

I would recommend James Hang for your employ or project without hesitation. My relationship with James has been nothing but positive.

Regards,

Bob Lea
